Education

University of Michigan

Computer Science BSE

Ann Arbor, MI

08/2014 – 04/2018

Minor in Entrepreneurship

Projects

Pray by Day

Prayer app for Android designed with international team

- Implemented full Android app, ~1,000 active users < 1 month after release ([Pray by Day](#))

Skills

Programming: I have had college, professional, and personal experience with different forms of Java development, C++, Python, JRuby, and more, but I am constantly learning. I have extensive experience with backend programming frameworks and languages.

Technologies: I am familiar with different development environments, development using Git and Bash, and developing on AWS and OCI, and have worked extensively with deployment systems, cloud native frameworks such as Docker, Kubernetes, Terraform, and a host of IaC config and infrastructure management solutions. I have used AI engines for development, testing, and integration into legacy codebases.

Web Development: I am familiar with HTML, CSS, JavaScript, ReactJS, AngularJS, Flask, MySQL, and more frontend development technologies, and have used them in my professional and personal projects.

Android Development: I have a self-taught use of Android Studio to develop mobile apps, including an app released to the Google Play store with 10,000+ downloads.

Professional Experience

Senior Software Engineer

BNSF

07/2026 – Present

Seattle, WA

- Sr SWE on the Workforce Management team at BNSF Railway contracted through TekSystems.

Software Engineer

Oracle

03/2024 – 10/2025

Seattle, WA

- Software Engineer 2 on the Oracle Cloud Migrations team.
- Built cloud migration platform features in Java on OCI supporting multi-cloud data migrations with low downtime and high availability across regions, using Python, Bash, Terraform, Docker, and Kubernetes.
- Solved security issues, reviewed designs/code, and shipped features that improved infrastructure efficiency and UX.
- Collaborated across engineering to manage operational load, metrics/dashboarding, build systems, deployments, and delivery lifecycle.
- Led workflow and performance refactors that removed compute bottlenecks and delivered \$50K/month in savings, 3 months ahead of plan.
- Migrated metrics APIs across 4 core services and built dashboards for weekly system-health analysis.
- Reworked deployment and operational procedures, reducing weekly on-call workload by 40%.
- Drove IaC standardization across systems to reduce errors from configuration misalignment.

Software Engineer

Blink Health

08/2021 – 03/2023

Seattle, WA

- Software Engineer 2 on the backend patient information and order-flow team.
- Automated patient order and refill workflows in Python on AWS, saving 2,000+ support hours per week company-wide.
- Automated production failure-response paths and improved reliability of refill and communication workflows.
- Refactored order-flow and prescription systems to onboard new pharmaceutical partners.
- Managed internal survey services and improved metrics coverage, SOP documentation, and team operational processes.
- Ran standups, contributed to design reviews, and drove on-call and operational improvements across the team.

Software Development Engineer

Amazon

08/2018 – 08/2021

Seattle, WA

- SDE on the Personalization Tools and Testing team, building internal tools for recommender-system development.
- Built and expanded performance testing services in Java on AWS and Linux-based compute fleets.
- Created metrics-driven scaling controls that improved fleet efficiency and reduced hosting costs by 35%.
- Partnered with internal customers to gather requirements and deliver iterative tooling improvements across Java, Python, and React.
- Built platform features used to analyze production recommendations and testing outcomes.
- Planned and implemented tooling changes for automated testing and production release scheduling.
- Led security and operational improvements that reduced team software risk by 94%; served as Scrum Master, Project Lead, and Technical Interviewer.
